LONG HAUL JOURNEY ASSISTED BY REDWEB TRACKER

RedWeb Technologies, the leading provider of advanced tagging and GPS tracking systems, has supplied a solution to help out amateur radio enthusiasts planning an international expedition.

The RX-11 Tracker has been fitted to a container shipping £125,000 worth of specialist radio equipment to Christmas Island in Eastern Kiribati in the Pacific Ocean.

The container, which is transporting equipment including antennae, electronics, radios and generators, has already begun its journey to the island, even though the event doesn't begin until September.

The expedition to the island has been organised by the Five Star DXers Association (FSDXA).

The event will run for a month between September and October 2011, during which time the FSDXA hopes to make over 150,000 contacts with 40,000 different amateur radio stations from around the world and regain some of its previously held world records.

Neville Cheadle of the Five Star DXers Association (FSDXA), said: "It is vital to know where the container is, as being in constant contact with people thousands of miles away is difficult. The RX-11 installed easily and works like a dream. The online tracking is fantastic."

The RX-11 Tracker is easily fitted to standard containers with a locking mechanism. It has a dual function: container lock and GPS tracker. The RX-11 can track a container for up to 12 months.

More information can be found by viewing www.redwebsecurity.com
